

2010-05: Weigel-TrackJet® at the Airport Show in Dubai

Dieter Pade (right) and Gerd Heinrich at the TrackJet®-booth at Airport show, Dubai. It is now almost a tradition, that many international visitors storm the Weigel booth and this occurred again on all 3 days of the exhibition despite the adverse effects of the volcanic ash on air traffic.

The booth personnel, headed by Dieter Pade, were able to report the results of TrackJet® operations showing that nearly 100% of rubber and paint markings are removed without damaging the basic structure of the runway. Many visitors were immediately interested and ultimately impressed by the system as a result of more intense conversations about the overall benefits.

In addition, the Weigel team were able to greet many long-term business partners, acquaintances and friends, who used the opportunity to discuss projects in person.

Much attention was directed towards the newest development from Weigel, the BudJet, which was first on show to the public in Dubai. BudJet is a machine for the removal of rubber and paint markings based on the TrackJet® technology. It offers the ideal solution for users on a low budget, who nevertheless don't want to forego the efficiency and benefits of systems from Weigel.

In summary, Weigel's presence at the Dubai airport exhibition was an astounding success and appealed to new clientele as well as established business partners.

The team would therefore like to thank all visitors to the booth, who helped to ensure this achievement.
